PRONOUNCEMENT

The person who signs here:

NAME :ALGALI A.M. ABAS

NIM :S941302044

Certifies that the thesis entitled:

STRENGTH AND DURABILITY OF ASPHALT CONCRETE MODIFIED CRUMB RUBBER

Is really his own work. Anything related to others' work is written in quotation, the source of which is listed on the bibliography.

If then, this pronouncement proves wrong, I am ready to accept any academic punishment. Including the withdrawal of this thesis and my academic degree.

Surakarta, 19 June 2015

The person who makes this Pronouncement

A handwritten signature in black ink, consisting of several overlapping loops and a long horizontal stroke at the bottom, positioned above the printed name.

ALGALI A.M. ABAS

ACKNOWLEDGEMENT

I am grateful to the Allah for the good health and wellbeing that were necessary to complete this research.

I wish to express my sincere thanks to Dr. Mamok Suprpto, M. Eng, Principal of the Faculty of Sebelas Maret University, for providing me with all the necessary facilities for the research.

I place on record, my sincere thank you to Dr. Eng. Ir. Syafi'I, MT, Dean of the Faculty, for continues encouragement.

I am also grateful to Ir.Ary Setyawan, M.Sc(Eng).,Ph.D, my supervisor and lecturer in the Department of Civil Engineering. I am extremely thankful and indebted to him for sharing expertise, and sincere and valuable guidance and encouragement extended to me.

I would like to express my sincere thanks and appreciation to Dr. Ir. Arif_Budiarto, MT

I take this opportunity to express gratitude to all of the Department faculty of civil engineering members for their help and support. I also thank my mother for the unceasing encouragement, support and attention. My dear father Times are hard. You always used to help me through everything. I am also grateful to my wife and my children who supported me through this venture.

I also place on record, my sense of gratitude to one and all, who directly or indirectly, have lent their hand in this venture.

ABSTRACT

Environmental problem becomes big problem if the trash is renewable and can not decompose. One of trashes which very dangerous to be neglected is tire rubber. Crumb rubber is an innovation for the development of asphalt concrete. The use of crumb rubber which is come from the recycle of tires is very beneficial on the environment and economic aspects. Based on the background, there are two research statements, namely: How is the influence of crumb rubber on asphalt concrete modification of strength aspect? How is the influence of crumb rubber on asphalt concrete modification on the durability aspect?

In the context of this research, the use of crumb rubber as asphalt modification to increase the strength and durability was depend on the asphalt content and percentages of crumb rubber itself. In terms of laboratory test, this research has been through many test for materials such as ITS, ITSM, UCS and OBC. All of the test were conducted to get the result about the influence of strength and durability on asphalt concrete modification with crumb rubber with several percentages, namely 0%, 3%, 4%, and 5%.

The existence of crumb rubber in asphalt mixture influenced the strength. The increased of the crumb rubber content, will influenced the decreased of the strength of mixture. It can be seen from the stability, ITS, UCS and ITSM. The score for those tests showed that the increased of crumb rubber would decreased the strength. The crumb rubber which can be recommended for the mixture was 4% with 5-5.5% of asphalt content. Then, the temperature also influenced the strength of the mixture. The higher of temperature would decreased the strength of mixture. The modification of asphalt with crumb rubber also influenced the durability. It can be seen from the density score, the maximum density was come from 4% crumb rubber content. Then, the increased of crumb rubber in the mixture (more than 4%) would decrease the density.

Keywords: crumb rubber, strength, durability

ABSTRAK

Masalah lingkungan menjadi masalah besar jika sampah yang tidak dapat terbarukan tidak dapat terurai. Salah satu sampah yang sangat berbahaya adalah karet ban. Karet remah adalah sebuah inovasi untuk pengembangan beton aspal. Penggunaan karet remah yang berasal dari daur ulang ban sangat bermanfaat terhadap lingkungan dan aspek ekonomi. Berdasarkan latar belakang, ada dua pernyataan penelitian, yaitu: Bagaimana pengaruh karet remah pada beton aspal modifikasi dalam aspek kekuatan? Bagaimana pengaruh karet remah di aspal modifikasi beton pada aspek daya tahan?

Dalam konteks penelitian ini, penggunaan karet remah sebagai modifikasi aspal untuk meningkatkan kekuatan dan daya tahan adalah tergantung pada kadar aspal dan persentase karet remah sendiri. Dalam hal uji laboratorium, penelitian ini telah melalui banyak tes seperti ITS, ITSM, UCS dan OBC. Semua tes dilakukan untuk mendapatkan hasil tentang pengaruh kekuatan dan daya tahan di aspal modifikasi beton dengan karet remah dengan beberapa persentase, yaitu 0%, 3%, 4%, dan 5%.

Keberadaan karet remah dalam campuran aspal dipengaruhi kekuatan. Peningkatan remah kadar karet, akan mempengaruhi penurunan kekuatan campuran. Hal ini dapat dilihat dari stabilitas, ITS, UCS dan ITSM. Rata bagi mereka tes menunjukkan bahwa peningkatan karet remah akan menurun kekuatan. Karet remah yang dapat direkomendasikan untuk campuran adalah 4% dengan 5-5,5% dari kadar aspal. Kemudian, suhu juga mempengaruhi kekuatan campuran. Semakin tinggi suhu akan menurunkan kekuatan campuran. Modifikasi aspal dengan karet remah juga dipengaruhi daya tahan. Hal ini dapat dilihat dari nilai kerapatan, kepadatan maksimum berasal dari 4% kadar karet remah. Kemudian, peningkatan karet remah dalam campuran (lebih dari 4%) akan menurunkan kepadatan.

Kata Kunci: karet remah, Kekuatan, daya tahan

Table Of Appendix

Appendix A

Appendix B

Appendix C

List of symbols

A	=	Weight of dry specimen in air
b	=	Volumetric flash + water + sand
B0	=	Optimum Bitumen Content
B1	=	% asphalt content at maximum unit weight.
B2	=	% asphalt content at maximum stability.
B3	=	% asphalt content at specified percent air voids in the total mix
Bsg	=	Bulk specific gravity
Bsg SSD	=	Bulk specific gravity SSD
c	=	Volumetric flash + water
d	=	Diameter of the specimen in mm to one decimal place.
d	=	Oven dry sand
D	=	The mean amplitude of the horizontal deformation obtained from 2 or more applications of the load pulse (mm),
F	=	Flow
h_{ave}	=	Average height of the specimen in mm to one decimal place.
I	=	Volume of bitumen
ITS	=	Indirect Tensile Strength in KPa.
ITSM	=	Indirect Tensile Stiffness Modulus
L	=	The peak value of the applied vertical load (N),
L	=	Volume of air voids
B	=	Marshall quotient
P	=	Maximum applied load in N.
P (Kn)	=	Maximum applied load in N
S	=	Weight of saturated surface dry specimen
t	=	The mean thickness of the test specimen (mm)
v	=	Poisson's ratio (a value of .35 is normally used).
VIM	=	The average of VIM
W	=	Stability
