

ABSTRACT

Angga Rohmah Nur Hayatun . R0316006. **INTEGRATED MIDWIFERY CARE ON Mrs. J, G2P1A0, AGED 30 YEARS OLD, AT COMMUNITY HEALTH CENTER OF PAJANG, SURAKARTA.** Associate's Degree Program in Midwifery, the Faculty of Medicine, Sebelas Maret University, 2019

Scope : Integrated midwifery care starts from gestation, labor, postpartum, neonatal, to family planning periods in order to guarantee maternal and neonatal welfare and early detections of complications.

Implementation : The continuity of care (COC) was conducted two times. Delivery was performed by C-section under indication of hypertension by conducting pre-operative and post-operative cares. Postpartum care was performed by giving counseling on postpartum period needs. Normal neonatal care was conducted by ensuring exclusive breastfeeding, which was followed with counseling about family planning program.

Evaluation : Problems were found during gestational care in the forms of swollen feet and hypertension, that doctors gave informed choice of delivery by induction or C-section. No complications were found during postpartum and neonatal periods, and the mother selected three-month contraceptive for her family planning program.

Conclusion and Recommendation : Gaps were found on the labor, postpartum, and neonatal cares in the forms of early breastfeeding initiation which was not conducted, time for vitamin A administration which did not fit the existing theories, and umbilical cord which was cared with closed treatment. Health workers are expected to facilitate early breastfeeding initiation, vitamin A administration, and umbilical cord treatment in accordance with midwifery standards of practice in Indonesia.
